SUMMARY

Software engineer: four years at JPMorgan Chase on a customer-facing account-opening application (Java, Spring Boot, Kafka, React, TypeScript), after five years in hospital informatics. Ships AI applications end to end, with tests, audit trails and privacy designed in.

EXPERIENCE

JPMorgan Chase — Plano, Texas

Software Engineer II · Jan 2024 – Oct 2026

- Helped launch a customer-facing account-opening application that cut the average time to open an account from more than an hour to about 15 minutes.
- Owned three of its services until handoff: a proxy, a Kafka-to-SSE adapter streaming application status and eligibility to the browser, and an aggregator that bundles internal-system data into one response.
- Served six months as interim lead for eight engineers (code review, mentoring, sprint ceremonies, roadmap planning with product) and shipped the MVP of a deceased-notification tool: a customer or beneficiary reports a death online in a few steps and an agent collects the documents and handles closures or transfers.
- Built a drag-and-drop generator for the internal UI component library: engineers compose a page and download a starter project, so new developers learn the component syntax and coding standards from generated code.

Software Engineer I · Oct 2022 – Jan 2024

- Built Java Spring Boot microservices and integrated enterprise APIs; led the design, testing and release of a React/TypeScript interface with Redux.

Presbyterian Healthcare Services — Albuquerque, New Mexico

Business Informatics III · Oct 2016 – Jul 2021

- Worked to cut referral cycle time from order to scheduled appointment in specialty and radiology departments by gathering clinic requirements and coordinating Epic Referrals and Cadence enhancements with analysts.
- Trained 600+ staff across 100+ departments on Epic Referrals and Cadence workflows.
- Carried out user acceptance testing for Epic upgrades, documenting defects and supporting their resolution.

PROJECTS

Caduceus | Python, FastAPI, React, TypeScript, PostgreSQL, FHIR, Cloud Run — caduceusdemo.netlify.app

- Prior-authorization agent for a simulated health system: reads the faxed referral, checks the record against the insurer's policy text, asks the clinician only for what's missing and drafts the request for specialist approval.
- Keeps patient data inside the clinic: a local model de-identifies text before it reaches the drafting model; 181 identifiers planted across the test suite, none reached the outside model. 200+ tests, hash-chained audit log.

Lattice | Rust, React, TypeScript, ROS 2, Gazebo, MuJoCo, PostgreSQL — lattice-robotics.netlify.app

- Robot-fleet control plane that keeps a mission's objective when the route or the body changes: a Rust core plans, holds detours and handoffs for approval and signs commands, and an agent on each robot verifies them.
- Three recorded simulation runs (blocked aisle, rover-to-quadruped handoff, two-rover handoff) with no completed inspection repeated; evaluations published with the code.

0VERTRAINED | React, Vite, Netlify Functions, Supabase, Web Push — 0vertrained.com

- Training ledger for athletes who lift and race, built alone: per-metric arbitration between Oura and Whoop, a daily readiness verdict from a week of HRV against a four-week baseline, and a server-routed LLM coach.
- In beta on version 19.6; 2,030 automated tests, row-level security on every table, encrypted wearable tokens.

SKILLS

Languages	Java, Spring Boot, Python, FastAPI, TypeScript, JavaScript, React, Redux, Rust
Data and APIs	PostgreSQL, REST, Kafka, HL7 FHIR, SMART on FHIR, Model Context Protocol (MCP), OAuth 2.0/OIDC
Delivery	Git, GitHub Actions, Docker, pytest, JUnit, Jest, Vitest, Playwright, Google Cloud Run, Netlify, Scrum
AI	LLM APIs, model routing and fallbacks, evaluation harnesses, agent tooling, de-identification
Healthcare	Epic Referrals, Cadence, MyChart (trained, not certified); referral and prior-authorization workflows

EDUCATION

App Academy · Full Stack Software Engineering Program, 1,000 hours — Jun 2022
