SUMMARY

Front end developer: four years at JPMorgan Chase, leading a React and TypeScript interface, helping launch a customer-facing account-opening application and building a drag-and-drop page builder for the bank's UI component library. Designs and builds accessible products alone, checked against WCAG 2.2 AA end to end.

EXPERIENCE

JPMorgan Chase — Plano, Texas

Software Engineer II · Jan 2024 – Oct 2026

- Built a drag-and-drop generator for the internal UI component library: engineers compose a page and download a starter project, so new developers learn the component syntax and coding standards from generated code.
- Helped launch a customer-facing account-opening application that cut the average time to open an account from more than an hour to about 15 minutes.
- Owned three of its services until handoff, among them the Kafka-to-SSE adapter that streams application status and eligibility to the browser in real time and an aggregator that gives the interface all it needs in one response.
- Served six months as interim lead for eight engineers (code review, mentoring, sprint ceremonies, roadmap planning with product) and shipped the MVP of a deceased-notification tool for customers and beneficiaries.

Software Engineer I · Oct 2022 – Jan 2024

- Led the design, testing and release of a React/TypeScript interface with Redux; built Java Spring Boot microservices and integrated enterprise APIs.

Presbyterian Healthcare Services — Albuquerque, New Mexico

Business Informatics III · Oct 2016 – Jul 2021

- Worked to cut referral cycle time from order to scheduled appointment in specialty and radiology departments by gathering clinic requirements and coordinating Epic Referrals and Cadence enhancements with analysts.
- Trained 600+ staff across 100+ departments on Epic Referrals and Cadence workflows.
- Carried out user acceptance testing for Epic upgrades, documenting defects and supporting their resolution.

PROJECTS

0VERTRAINED | React, Vite, PWA, Web Push, Netlify Functions, Supabase — 0vertrained.com

- React PWA for athletes who lift and race, designed and built alone: its own design system, broadsheet layouts on wide screens, a workout session runner, web push and lazy-loaded tab bundles.
- In beta on version 19.6 with 2,030 automated tests; a seeded demo mode drives the same screens with fixed data.

Caduceus | React, TypeScript, Vite, Playwright, axe-core — caduceusdemo.netlify.app

- Review interface for a prior-authorization agent, designed for office staff who are not technical: plain language, a text-size control, and every screen checked against WCAG 2.2 AA with axe-core, down to 320 px wide.
- Shows its work: a "What was sent to the model" view puts the de-identified text in front of the reviewer.

Portfolio | HTML, CSS, JavaScript, WebGL 2, no framework — 0vertrained.github.io

- A WebGL 2 view of the Santa Fe sky computed from the real positions of the sun, moon and stars, with a CSS fallback, reduced-motion and color-scheme support, and no build step.

Lattice | React, TypeScript, Rust — lattice-robotics.netlify.app

- Operator interface and guided public tour for a robot-fleet control plane: mission state, approvals for detours and handoffs, and replays of recorded runs.

SKILLS

Front end	React, TypeScript, JavaScript, Redux, HTML, CSS, Vite, WebGL 2, PWAs, accessibility (WCAG 2.2 AA)
Testing	Playwright, axe-core, Vitest, Jest, pytest, JUnit
Back end	Java, Spring Boot, Python, FastAPI, PostgreSQL, REST, Kafka, Server-Sent Events, OAuth 2.0/OIDC
Delivery	Git, GitHub Actions, Docker, Netlify, Google Cloud Run, Scrum
AI	LLM APIs, model routing and fallbacks, evaluation harnesses

EDUCATION

App Academy · Full Stack Software Engineering Program, 1,000 hours — Jun 2022
