SUMMARY

Engineer who has worked on both sides of a deployment: five years inside a hospital system turning clinics' needs into Epic changes and training 600+ staff to use them, then four at JPMorgan Chase building customer-facing software. Builds AI applications for regulated work end to end, from workflow to audit trail.

EXPERIENCE

JPMorgan Chase — Plano, Texas

Software Engineer II · Jan 2024 – Oct 2026

- Helped launch a customer-facing account-opening application that cut the average time to open an account from more than an hour to about 15 minutes.
- Served six months as interim lead for eight engineers (code review, mentoring, sprint ceremonies, roadmap planning with product) and shipped the MVP of a deceased-notification tool: a customer or beneficiary reports a death online in a few steps and an agent collects the documents and handles closures or transfers.
- Built a drag-and-drop generator for the internal UI component library: engineers compose a page and download a starter project, so new developers learn the component syntax and coding standards from generated code.
- Owned three of its services until handoff: a proxy, a Kafka-to-SSE adapter streaming application status and eligibility to the browser, and an aggregator that bundles internal-system data into one response.

Software Engineer I · Oct 2022 – Jan 2024

- Built Java Spring Boot microservices and integrated enterprise APIs; led the design, testing and release of a React/TypeScript interface with Redux.

Presbyterian Healthcare Services — Albuquerque, New Mexico

Business Informatics III · Oct 2016 – Jul 2021

- Worked with specialty and radiology clinics to cut referral cycle time from order to scheduled appointment, gathering their requirements and coordinating Epic Referrals and Cadence enhancements with analysts.
- Trained 600+ staff across 100+ departments on Epic Referrals and Cadence workflows.
- Carried out user acceptance testing for Epic upgrades, documenting defects and supporting their resolution.

PROJECTS

Caduceus | Python, FastAPI, React, FHIR, SMART on FHIR, OIDC, Cloud Run — caduceusdemo.netlify.app

- Prior-authorization agent built as a deployment for a simulated health system: reads the referral, checks the record against insurer policy, asks the clinician only for what's missing and drafts the request a specialist approves.
- Fits the customer's systems: launches from the EHR (SMART on FHIR), signs in through the clinic's identity provider and keeps patient data inside the clinic; of 181 planted identifiers, none reached the outside model.

Lattice | Rust, React, TypeScript, ROS 2, Gazebo, MuJoCo — lattice-robotics.netlify.app

- Robot-fleet control plane that keeps a mission's objective when the route or the body changes: a Rust core plans, holds detours and handoffs for operator approval and signs commands; an agent on each robot verifies them.
- A guided public tour replays three recorded runs: no completed inspection repeated after a detour or handoff.

0VERTRAINED | React, Netlify Functions, Supabase (PostgreSQL) — 0vertrained.com

- Training app for athletes who lift and race, taken alone from idea to beta: per-metric arbitration between Oura and Whoop, a daily readiness verdict and a server-routed LLM coach.
- In beta on version 19.6; 2,030 automated tests, row-level security on every table, encrypted wearable tokens.

SKILLS

AI	LLM APIs, model routing, evaluation harnesses, Model Context Protocol (MCP), de-identification
Integration	HL7 FHIR, SMART on FHIR, OAuth 2.0/OIDC, REST, Kafka, Server-Sent Events, PostgreSQL
Languages	Python, FastAPI, TypeScript, React, Java, Spring Boot, Rust
Delivery	Git, GitHub Actions, Docker, Google Cloud Run, Netlify, Playwright, pytest, Scrum
Healthcare	Epic Referrals, Cadence, MyChart (trained, not certified); referral and prior-authorization workflows

EDUCATION

App Academy · Full Stack Software Engineering Program, 1,000 hours — Jun 2022
